

Sharepoint Restore Questions

I'm testing our DR plans for SharePoint Portal Server and I want to test the backups I've made of the WSS sites using stsadm.exe. Can anyone advise how I can restore each site backup to the SAME SERVER (with a different name, of course) to test the backups worked ok? Obviously I don't want to make any changes to the Portal site or any existing WSS sites. Do I need a new content DB? Should I set up a new managed path for the restores? If so, how? I want to use stsadm.exe (-restore) to restore the sites. Any help or advice would be most welcome.

Answer :: You could investigate one of the commercial tools available such as Galaxy Backup Recovery. These tools often make the restore procedure simpler. See link below. [Read More](#)
